3:24 PM

1a

1b

1c) option B is optimal for player 1 as  $1 > -3$  and root node is a max node so play will choose higher of two values

therefor option B is optimal for player 1

1d) expected outcome is minimax value at root node which is 1

1e) For  $\alpha = -\infty$  and  $\beta = \infty$

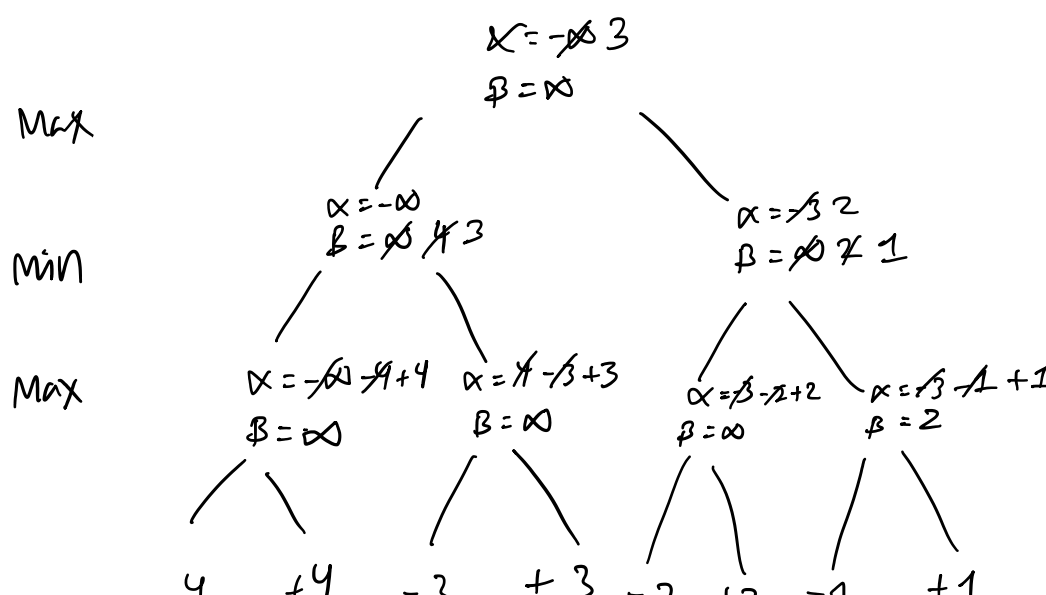

1f) For max nodes put best values early & for min nodes put worst values early

For max pruning try and have max values on left & min on right best case is branch A right & B right can be pruned

1g)

2) a)

Variables

P1 -> person in position 1

P2 -> person in position 2

P3 -> person in position 3

Domain

each var can take any 3 hikers {A, B, C}

but no hiker can be repeated

constraints

1) each person needs appear at least once

and  $P1 \neq P2 \neq P3$

2) Adjacent degrees must differ

$\text{degree}(P1) \neq \text{degree}(P2)$

$\text{degree}(P2) \neq \text{degree}(P3)$

3) Carol  $\neq$  P3

b) Nodes = Variables

Edges = constraints

c) Try P1 = A ✓

→ Try P2 = A X same as P1

Try P2 = B → degree constraint met ✓

→ Arrows indicate backtracking

→ Try P3 = A X same as P1

→ Try P3 = B X same as P2

→ Try P3 = C X Carol is last violates constraint

→ Try P2 = C X violates degree constraint

→ Try P1 = B ✓

Try P2 = A ✓

→ Try P3 = C X Carol last violates constraint

→ Try P2 = B X violates  $P1 \neq P2$

Try P2 = C ✓

→ Try P3 = A X  $\text{degree}(P2) \neq \text{degree}(P3)$

→ Try P1 = C ✓

→ Try P2 = A X  $\text{degree}(P2) \neq \text{degree}(P2)$

Try P2 = B ✓

Try P3 = A ✓

d) MRV = min remaining value

P1 P2 P3

A cannot go P2

B can go anywhere

C cannot go P2 or P3

So start Assigning one with most constraints

Try P1 = C

remaining elements

$P2 \in \{A, B\}$

$P3 \in \{A, B\}$

Try P2 = A (A has less options left) X degree constraint

→ Try P2 = B ✓

Try P3 = A

Ans  $P1 = C, P2 = B, P3 = A$
